

Base de données / A quoi ça sert ?

Python connector

Python et MYSQL

Import de mysql connector

Création de l'objet de connection

Création de l'objet mycursor qui me permettra d'effectuer des requêtes sql

```
import mysql connector
db = mysql.connector.connect(
  host = "localhost".
  user = "root",
  password = "dssdfv",
  database = "my db"
mycursor = db.cursor()
mycursor.execute("SELECT * FROM person")
res = mycursor.fetchall()
for line in res:
  print(line)
```

La méthode

commit()

Insert

Update

Delete

```
import mysql.connector
db = mysql.connector.connect(
  host = "localhost",
  user = "root",
  password = "dssdfv",
  database = "my db"
mycursor = db.cursor()
sql = "INSERT INTO person (name, address) VALUES (%s, %s)"
val = ("John", "Highway 21")
mycursor execute(sql, val)
db.commit()
print(mycursor.rowcount, "record inserted.")
```

- import (déjà intégré) ok
- connexion ok
- cursor (le fermer) ok
- execution requête ok
- modif bdd -> commit bdd mettre à jour ok
- accents / requêtes vraiment similaires
- fetchOne/fetchAll ok
